

GLOBALCON 2002 Philadelphia, Pennsylvania March 27, 2002

Application of Advanced Energy Technologies

Michael K. West, Ph.D., P.E. Building Systems Scientist Advantek Consulting, Inc.

www.advantekinc.com

- Strategic Project Management & Prioritization
- Specialists in Energy Efficiency Technology
 - Analysis
 - Engineering
 - Implementation
- Attention to Overall Building Performance
- A Small Business Vested in Your Success

MAIN POINTS of Presentation

- Advanced technologies provide savings in addition to savings from standard lighting and HVAC retrofits by 50% or more
 Proper application of advanced technology requires a thorough systems-based energy survey and rigorous engineering
- Longer payback periods require detailed economic analysis and innovative financing requirements to achieve economic viability

Strategic Energy Management

A well thought out plan includes: Explicit savings goals ✓ Strategic project prioritization and focusing of resources ✓ Attention to both *operations* and *technology* Comprehensive energy and water surveys Application of the best available advanced technologies ✓ Financing options and review of rebates and incentives \checkmark Coordination with Green Lights[®] and ENERGY STAR[®] ✓ Proactive Training and Preventative Maintenance Planning ✓ Options for making the most of utility restructuring ✓ Measurement & Verification of Savings

ECM CHECKLIST

Building Room

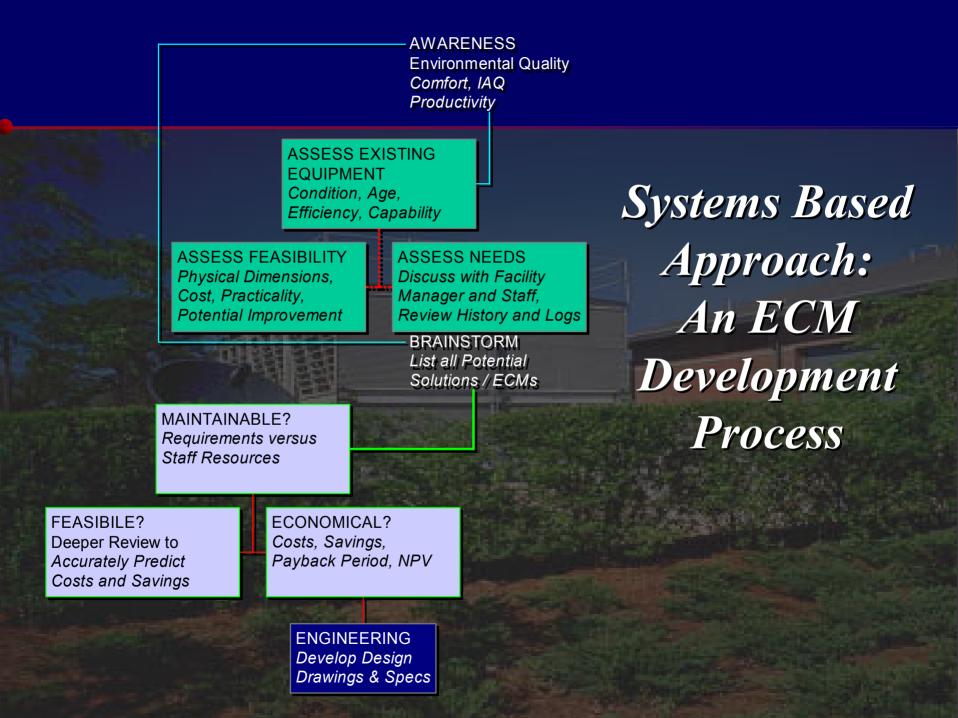

LIGHTING

- □ UPGRADE TO T8 LAMPS
- □ COMPACT FLORESCENTS
- □ CHANGE EXIT SIGNS TO LED
- □ INSTALL OCCUPANCY SENSORS
- □ PHOTOCELL OR TIMER

HVAC

- □ VARIABLE SPEED DRIVE
- CHILLER REPLACEMENT
- □ CONTROL SYSTEM UPGRADE
- REPLACE CONDENSING UNIT
- SETBACK THERMOSTAT

Equipment Based Approach: An ECM **Checklist**

Advanced HVAC Technologies

- Internet Communicating Thermostats
- Dual Source (Ground-plus-Air) HVAC
- Desiccant Fresh Air Pre-Conditioning
 - Micro-Turbine CHP (GLOBALCON Track 1)
- Engineered Package Unit Modifications
- Solar Hot Water Heating
- Cold Air Distribution
- Heat Pipe Heat Recovery
- Demand Controlled Ventilation (DCV)
- Thermal Storage

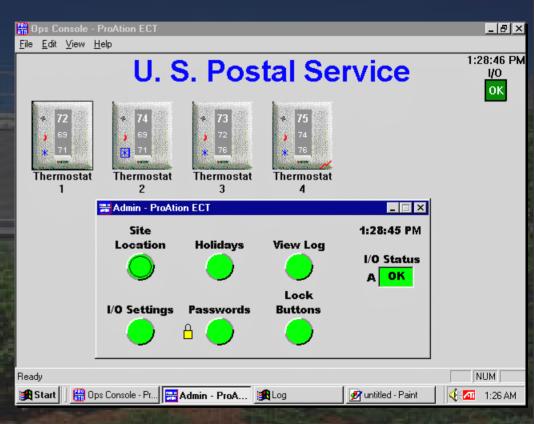

Advanced Energy Technologies

LOAD SHIFTING

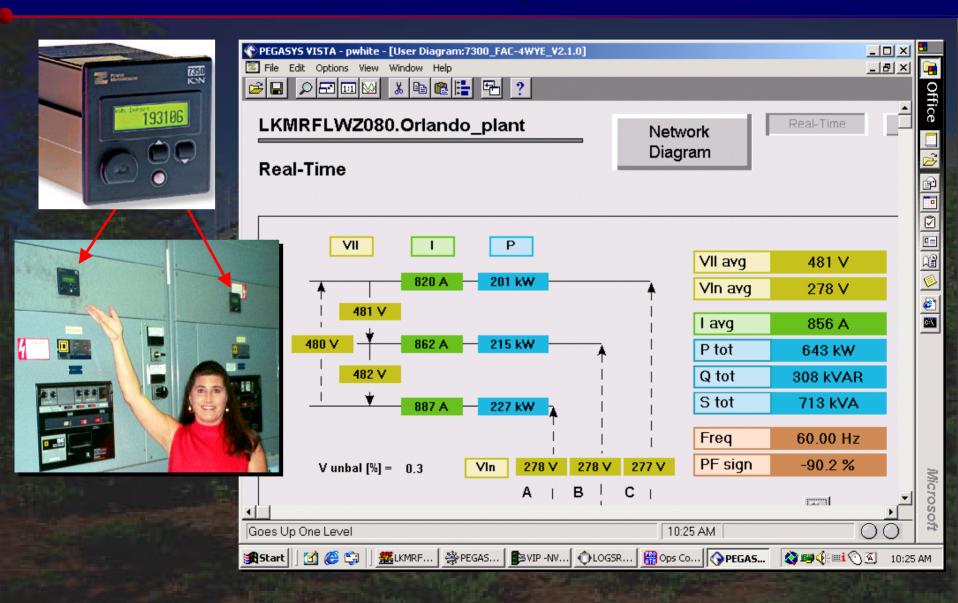

- On-Site Co-generation
 - Micro-Turbine, Fuel Cells, Absorption Chiller
- Web-enabled Power Meters (GLOBALCON Session 2B)
- BAS Load Shedding and Demand Limiting
- RENEWABLE ENERGY
 - Solar Ventilation-air and Space Heating
 - Solar Shower, Kitchen, and Lavatory Water Heating
 - PV electricity for remote sites and emergency power

ECM Example: Internet Communicating Thermostats

- Monitor and Control All
 Thermostat Functions
- Access from any PC
- Observe, Trend, and Limit Set Point Changes
- Auxiliary Control and Monitoring of Lighting
- Cost Effective BAS for Groups of Smaller Buildings

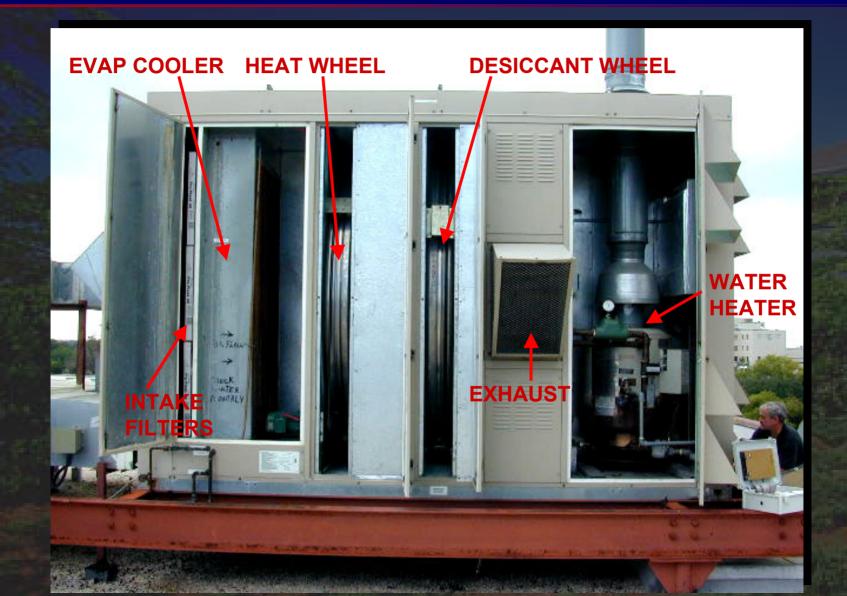

ECM Example: Internet Communicating Power Monitors

ECM Example: Internet Communicating Power Monitors

- Demand Responsive Buildings
 - Real time building/account metering
 - Sliding window interval data recording
 - (15-minute interval)
 - Web Access TCP/IP Communications
 - Provides building operators ability to reduce HVAC, lighting, or process loads in response to price signals

ECM Example: Desiccant Ventilation Units

ECM Example: Desiccant Ventilation Units

Energy Efficiency

- Manufacturer's peak load rating: 0.73 COP
- Measured peak load rating: 0.83 COP
- Measured average: 0.53 COP
- Cooling Capacity
 - 19% less dehumidification than rated
 - 155 MBH measured versus 248 MBH rated
- Heat Input
 - 12% less than manufacturer's rating

ECM Example: Micro-Turbine CHP

Microturbines - commercially available clean power

- Capstone 30 kW or 60kW
- Waste heat is used to power desiccant unit

Application Example: Patrick Air Force Base Dormitories

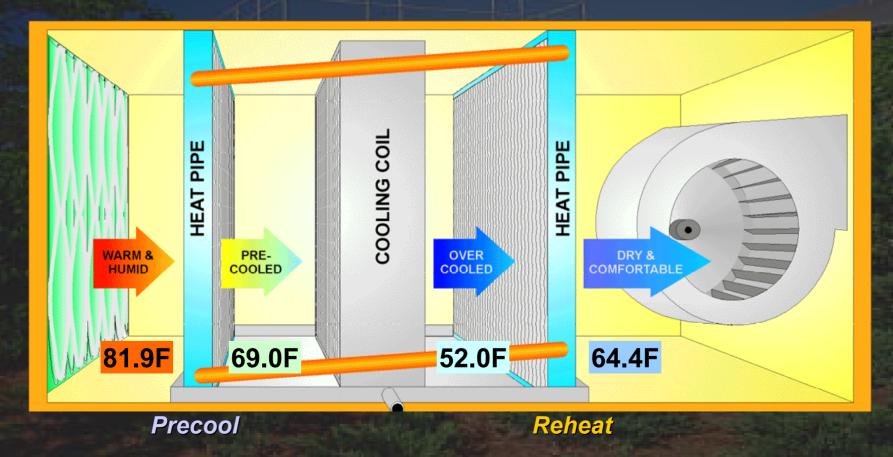

Four 30kW Microturbines 370 kW load shed 190 MBH Hot Water for Showers & Laundry 15,480 cfm Conditioned Outside Air

Annual Savings: \$38,000 Installed Cost: \$225,000 Simple Payback: 6 years

ECM Example: Dehumidifier Heat Pipe

- Doubles Latent Heat Capacity
- 60% More Energy Efficient than Electric Reheat

Rigorous Engineering & Savings Analysis

- Visual DOE2.1e
- Energy-10
- e-Quest
- System Analyzer
- Joint Frequency BIN
- Desi-Calc
- Proprietary Software

ECM Example: Cold Air Distribution

- More Energy Efficient
- More Dehumidification
- More Occupied Space
 - smaller mechanical rooms
 - less space above ceiling
 - smaller chases
- More Effective Ventilation
 - Higher fraction of fresh air
 - Better room mixing

- Smaller Fans
- Less Ductwork
- Less Piping
- Smaller Pumps
- Smaller Motors
- Less Energy Use
- Lower First Cost

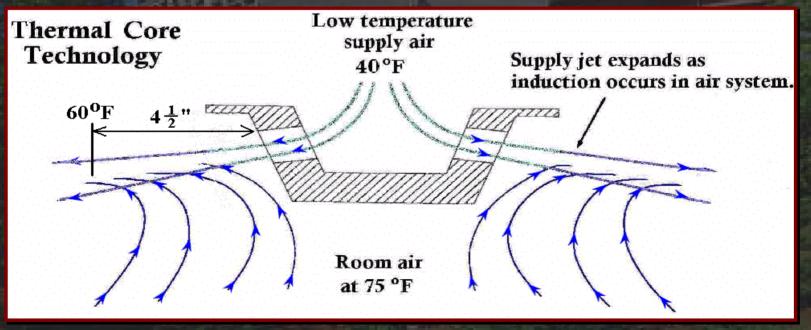

Cold-air electric savings

Compare the electric costs for a 225-ton chilled water system with 15,000 cfm of fresh air.

Cold Air Distribution

- Selection of supply diffusers is critical to prevent condensation on diffusers and ceiling, and to ensure adequate mixing with room air at lower cfms.
 - Proper sizing (throw & cfm), location, and insulation
 - Requires a high induction ratio (>2.0)

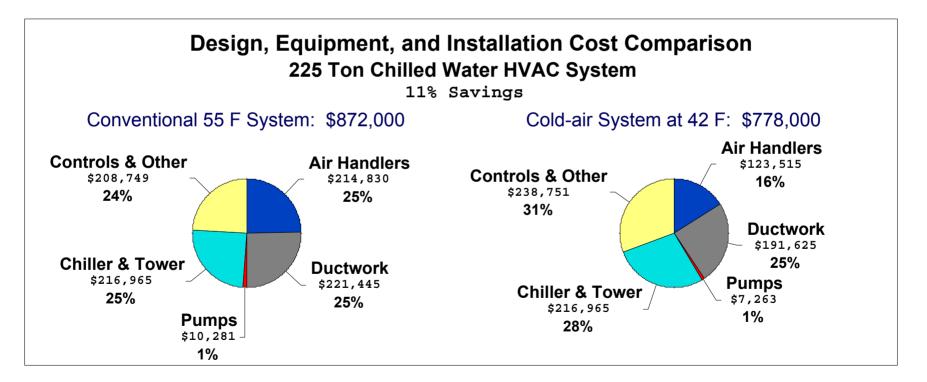

Insulation Thickness for Cold Air

DUCT HANGER	INSUL	ATION	Conilien	sation		
SUP	PLY AIR = 40 F		Cold-Air Duct Ins			
		and the second	FOR SUPPLY AIR	40	DEG F

			GR/LB	150	124	
		DP - LAT	WET BULB	80	75	
DUCT WALL	R-value = 0.62			50		
		DB - DP	R-VALUE	7	3	
		CONTRACTOR OF	INCHES	2.7	1.1	

Cold-air equipment savings

Compare the design, equipment and installation costs for a 225ton chilled water system with 15,000 cfm of fresh air. Life-cycle cost savings is about \$5 per square foot.

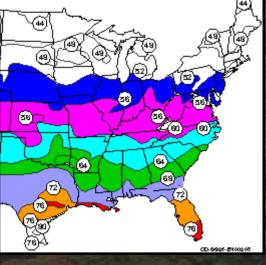

ECM Example: Dual-Source Heat Pumps

- Combines the energy efficiency of ground-source with the low first cost of air-source
- Uses ground-coupling to extend the delta-T available from ambient air

Application Example: MS Naval Training Classroom Building

24,730 square feet Two 35-ton Roof Top Package Units Electric Cost: STANDARD AC: \$17,600 DUAL-SOURCE: \$12,400 (30%) GEOTHERMAL: \$8,000 (55%)

Installed Cost / Payback STANDARD AC: \$30,000 DUAL-SOURCE: \$49,000 / 3.6 years GEOTHERMAL: \$125,000 / 9.9 years

Advanced Technology Applicability

Financing Advanced Projects

• Three Basic Types for Energy Projects - Traditional Capital Payment » pro: Facility has total control of the project » con: Need capital dollars - Performance Contract » pro: ESCO Fully Finances Project » con: ESCO controls project -<u>Hybrid Financing</u>

» Combines the best of Capital with Financing

MAIN POINTS

 Advanced technologies provide savings in addition to savings from standard lighting and HVAC retrofits by 50% or more • Proper application of advanced technology requires a thorough systems-based energy survey and rigorous engineering • Longer payback periods require detailed economic analysis and innovative financing requirements to achieve economic viability
